This two week online course equips UN analysts and data practitioners with practical skills to systematically assess and improve data quality using Python.

Introduction

Poor-quality data remains one of the most costly and persistent challenges facing organizations today, undermining analysis, weakening evidence, and eroding trust in decision-making. This course equips United Nations (UN) personnel - analysts and data practitioners - with practical skills to systematically assess, diagnose, and improve data quality before it reaches dashboards, models, or senior decision-makers. Through hands-on exercises, participants will learn how to identify common data issues, apply structured quality checks, and implement corrective actions using the Python programming language. No prior experience with Python is required.

Objectives

By the end of the course, participants will be able to:

- Explain data quality dimensions in UN contexts (i.e. accuracy, completeness, timeliness, consistency)
- Use Python to profile, clean, and assess UN real-world datasets
- Define transparent, auditable data quality rules
- Document and communicate data quality decisions for evaluation, reporting, and policy use
- Apply data quality practices to UN data sets, survey, or programme data

Course methodology

This is an online-led instructor course.

Participants will get access to the UN Learn platform, where they will find the asynchronous learning material. They will have the opportunity to practice with optional exercises between the webinars, interact with instructor and peers in discussion forums, and work on a final assignment.

The weekly instructor-led webinars are conducted on Zoom. The webinars will take place every Tuesday and Thursday from 3:00 PM to 4:30 PM CET. Participants need a computer (or mobile device), a reliable internet connection and either a headset with a microphone to connect to the audio through a computer.

Python tools:

- Any Python Integrated Development Environment (such as Jupyter Notebook, which can be downloaded for free as part of the Anaconda Distribution)
- Google Colab (accessible through any web browser)

Course contents

This course offers a dynamic and engaging virtual learning experience, guiding participants through practical exercises.

The course is organized in 2 weekly modules, as follows:

WEEK 1

Data Quality foundations and Python introduction

- What “good data” means in the UN system
- Common data quality issues in datasets, survey, and administrative data
- First hands-on Python experience (no heavy coding)
- Use of Large Language Models (LLMs) to help with coding challenges, along with avoiding LLM-related pitfalls

Data profiling and data cleaning with Python: Systematically assessing data quality

- Data profiling as a foundation for data quality
- Moving from manual inspection to structured, repeatable data quality assessment
- Identifying data quality issues, including missing values, duplicates, data type issues, and category inconsistencies

WEEK 2

Data consistency and validation with Python

- Applying rule-based data cleaning using Python based on profiling results
- Establishing consistent rules for handling missing values, duplicates, invalid records, and inconsistent categories
- Building reproducible cleaning workflows suitable for UN operational and evaluation contexts

Documenting and applying data quality in UN work

- Documenting data quality decisions in Python
- Applying Python-based data quality checks in real UN workflows

In the final activity, participants will apply profiling, cleaning techniques, and data quality rules to document either their own dataset or a provided UN dataset.

Target audience

This course aims to equip UN personnel at all levels with practical skills to assess, improve, and responsibly use data in their day-to-day work.

Cost of participation

\$ 550
